Case Study

The attractive brick steps into the garden from the rear of this conservatory in Southport were made with a combination of facing bricks to match the rear wall and Engineering bricks on edge for the perimeter.

To point the top surface of the brick paving steps the owner wanted a contrasting, darker coloured paving grout that was quick and easy to apply despite the damp weather conditions; in order to minimise the necessary waiting time to allow them to use the steps and access their garden.

The ideal solution was **vdw 840plus**, the one-component, polymeric sand based jointing mortar for use in domestic, non-trafficked areas. It is quickly and easily slurry applied by squeegee using more water and it effectively self-compacts into the joints. After a few minutes drying any excess is brushed off and the surface is given a final rinse – Job done!
